

SECURITY & ARCHITECTURE SUMMARY

Security & Architecture Summary

A concise reference for security and architecture reviewers: the governed pipeline, the security model, deployment topology and data-residency posture.

DOCUMENT	VERSION	AUDIENCE	DISTRIBUTION
Security & Architecture Summary	2026.06	Procurement & technical evaluation	Public — no NDA required

The governed pipeline

A submission becomes an Official Record through an enforced sequence: **Create** → **Review** → **Approve** → **Authorize** → **Publish** → **Certify** → **Verify** → **Preserve**. The approval policy is resolved per document type and classification; nothing reaches publication without satisfying it.

Security model

CONTROL	DETAIL
Tenant isolation	Row-level security on every table; a missing tenant claim denies by default.
Encryption	AES-256 at rest; TLS 1.2+ in transit.
Authentication	OAuth2 client-credentials; short-lived, scoped tokens. Identity/SSO integration during deployment.
Authorization	Least-privilege scopes — author, reviewer, approver, publisher, auditor, administrator.
Separation of duties	A submitter cannot approve their own document; enforced and logged.
Immutable audit	Append-only, SHA-256-hashed trail of every submission, decision and publish.
Classification	Documents carry visible classification; reads are gated against clearance where enabled

Deployment & residency

The same governed pipeline is delivered into the operating model the institution's mandate requires — cloud, private cloud, sovereign hosting, on-premise or air-gapped. Dispatch runs against its own dedicated database, independent of any other platform. Residency follows the deployment model; specific regions, data handling and retention terms are agreed per institution.

Verification & preservation

- **Governance Certificate** — proof the approval chain was satisfied, office by office, in order.
- **Preservation Certificate** — the retention horizon and a tamper-evident integrity hash.
- **Evidence chain** — every action, timestamped and append-only.
- **Public verification** — any record confirmed genuine, unrevoked and untampered by its Record ID, with no account.

This summary asserts no third-party certifications. Security documentation and architecture-review materials are available to qualified institutions during evaluation.
