

PROCUREMENT OVERVIEW

Sovereign Dispatch — Procurement Overview

Sovereign Dispatch is institutional trust infrastructure: it turns institutional decisions into governed, certified and permanently verifiable Official Records. This overview gives a procurement and technical evaluation team what it needs to assess the platform without a sales call.

DOCUMENT	VERSION	AUDIENCE	DISTRIBUTION
Procurement Overview	2026.06	Procurement & technical evaluation	Public — no NDA required

What it is

An institution does not pay to create a document — it pays for everything that makes a document **official**: the people, the reviews, the approvals, the authority, the preservation and the proof. Sovereign Dispatch unifies, governs, certifies and preserves that entire process on one platform, and makes every published record independently verifiable.

Governed workflow

Draft, review, approval and authorization in one policy-enforced pipeline. Nothing skips a step.

Permanent Official Record

Each publication receives a permanent Record ID and a hash-stamped artefact, never reused.

Certificates & evidence

A Governance Certificate, a Preservation Certificate and an append-only evidence chain travel with every record.

Independent verification

Anyone holding a copy can confirm it is genuine, unrevoked and untampered — with no account.

Deployment models

MODEL	SUMMARY
Cloud	Managed deployment for rapid adoption.
Private Cloud	Dedicated institutional environment.
Sovereign Hosting	Hosted within approved national or regional boundaries.
On-Premise	For institutions requiring local control.
Air-Gapped	Architecture designed to support isolated deployments; availability subject to engagement scope.

Security & sovereignty

- **Tenant isolation** — row-level security on every table; a missing tenant claim denies by default.
- **Encryption** — AES-256 at rest; TLS 1.2+ in transit.
- **Authentication** — OAuth2 client-credentials issuing short-lived, scoped tokens; identity/SSO integration during deployment.
- **Least privilege** — author, reviewer, approver, publisher, auditor; each scoped to exactly its actions.
- **Immutable audit** — append-only, SHA-256-hashed trail of every submission, decision and publish.
- **Data residency** — determined by deployment model; specific regions and retention terms agreed per institution.

Pricing

Priced like institutional infrastructure — by institution and capability, **never per seat**. Concrete figures for the self-serve tiers are published openly; Enterprise and Sovereign deployments are scoped per engagement. See the public pricing page.

Procurement FAQ

Do we need a sales call to evaluate?

No. The evaluation dossier is self-serve and you can begin a free evaluation in your own environment.

Can we evaluate in our own environment?

Yes — managed cloud, private cloud, sovereign hosting, on-premise and air-gapped deployments are supported.

By institution and capability, never per seat. Self-serve tier prices are public.

Where does our data live?

Residency is a deployment decision agreed per institution. Dispatch runs against its own dedicated database.

How do users authenticate?

OAuth2 client-credentials with short-lived, scoped tokens. Identity and SSO integration is arranged during deployment planning.

Can it integrate with our existing systems?

Yes — ERP, case-management and document systems integrate through the Dispatch API.

What can we verify independently?

Any published record, through the public verification portal, with no account.

This document uses verifiable language. It asserts no certifications, SLAs, uptime figures or guarantees; those are defined per agreement during evaluation.
